Teaching Philosophy & Profile

Ph.D. in Computational Mathematics with **15+ years of classroom teaching** across universities in Armenia and the UAE, combined with 20+ years of professional software engineering and active research. I believe rigorous computer-science education must connect theory to practice: my courses consistently move students from first principles to hands-on implementation using real systems.

Current areas of instruction span **programming (C, C++, Python)**, **system architecture**, **data structures & algorithms**, **operating systems**, **IoT & security**, **machine learning & data science**, and **statistics**. Active researcher in intrinsically **explainable AI** via polynomial regression models, applied to medicine (ECG and clinical diagnosis), materials science, precision agriculture, and ocean/climate science, and in **HPC & compiler engineering**: LLVM-based automatic parallelisation (HPC++) and binary lifting of legacy code (LEAP). 25+ publications, including accepted and published IEEE-indexed conference papers, several manuscripts under review, and a pending patent, with a track record of integrating research directly into the classroom. Currently **Chief Scientist** at ExplainableAI.app and **Assistant Professor and Course Team Leader** (multi-campus) at Higher Colleges of Technology, Abu Dhabi.

Research & Industry Experience

Research

Chief Scientist Jan 2026 – Present
ExplainableAI.app

- Directing scientific strategy and model architecture for a no-code ML platform built entirely on intrinsically interpretable polynomial regression models — no black-box neural networks.
- Platform combines browser-side WebAssembly training (data never leaves the device), a hand-written C++ inference engine with sub-millisecond latency, and an AI App Builder (powered by Gemini) that turns any trained model into a shareable live web app.
- Applicable to any domain: users train models on any CSV or image dataset and deploy them as shareable live apps — no code, no infrastructure required.
- Authored 15+ research papers in 2026 advancing the theory and application of PRMs across computer vision, healthcare (multi-class ECG), materials science, precision agriculture, ocean/climate monitoring, and structural engineering; several under review, one published and two accepted at IEEE-indexed conferences, plus a pending high-entropy-alloy design patent.

- Delivered production-oriented results: interpretable multi-variable ocean models running in 0.88 ms on an ESP32, a 657 KB Sentinel-1 oil-spill detector at 11,500 tiles/s, and a 123M-parameter ECG classifier compressed 99.7% (1.3 MB) with negligible loss.
